Kapitel 1

Logistic

The goal of this chapter is to describe which features are needed to make it for users easier to control the logistic in eressea.

- Every unit should have the possibility to issue an order. This should be something like: I want 5 wood.
- It should be possible to give the orders priorities. That should ensure that if two units want the same resource the one with the higher priority should get it
- The script should give an estimation of the time it will take for the resource to arrive
- The script should not use any resources which is reserved by a unit
- the script should be not much slower in sending the resource than a human
- The script has to be stable in the sense that if a transporter is destroyed or used for something different the script should still be able to get the resource to the right location
- The script should be able to print for all ressourcce where they are going and for which order they are

1.1 Stock Unit

A Stock unit stays in a region. Every resource the unit has can be send to people who demand the resource. The unit may not use other resources. The unit is defined by a comment. First it has the keyword stock which makes it to the stock unit. Than it has the 'mailcode' of the region. This code has to be unique in the report.

Example:

$$\sharp \quad stock \quad 00021$$

1.2 Moving Units

A moving unit can be a person by foot, or riding a horse, guiding a horse or a person on a ship. the code is the following:

$$\sharp \quad transporter \quad startregion \quad endregion \quad capacity \quad duration$$

- startregion - the mailcode of the startregion
- endregion - the mailcode of the endregion
- capacity - the capacity of the transporter will not be calculated
- duration - the number of turns between the start end the end region

Eample:

$$//\sharp \quad transporter \quad 00021 \quad 00015 \quad 102 \quad 2$$

1.3 Orders

An Order looks as follows:

$$//\sharp \quad order \quad n \quad resource \quad p$$

- $n \in N_0 \cup \{ALL\}$ - is the amount of the ressource which shall be brought to the unit

- resource - is the name of the resource
- $p \in [0 \dots 9]$ - is the priority of the transport, 9 is the highest, 0 is the lowest.

Example:

$$//\sharp \quad order \quad 25 \quad stone \quad 3$$

The unit with this comment orders 25 stone with a priority of 3.

Kapitel 2

Teaching Learning

Which features do we need?

- teacher try to teach only those units which are x level below them
- teacher teach only if they have at least x percent students
- teacher can be taught by teacher
- a student can be a teacher
- master teachers teach only if they can teach the highes unit which has as many students as they can teach
- if in a region are not enough teachers the script should warn the user
- if in a region are too many teachers, the script should inform the user that more students can be trained
- what is too many and what is not enough?

Kapitel 3

Trading

Which features do we need?

- the traders should be optimized for a long time run
- the trading should be compatible with the logistic
- complet automatic buying and selling
